

IOT-BASED THERMAL DATA LOGGING AND USER IDENTIFICATION

B.Sc. Project

By Piyush Pattanayak

Guided By Rashmirani Panda and Arijit Ghosh

Date:04.05.2024

OUTLINES

- INTRODUCTION
- OBJECTIVES
- PREREQUISITES
- MODULE OVERVIEW
- DATA IMPLEMENTATION AND INTEGRATION
- CONCLUSION AND FUTURE WORK

Introduction

Introduction

- In today's interconnected world, efficient data collection and analysis are crucial for various applications, including healthcare, security, and inventory management.
- Our project aims to combine RFID technology with temperature sensing capabilities to create a comprehensive monitoring system.
- By integrating with Google Sheets, we make it easy for seamless data logging and analysis, enabling real-time insights and decision-making.

Objectives

- Capturing real-time thermal data
- User identification with personalized data logging and analysis
- User-friendly interface
- Exploring potential applications

Introduction

Prerequisites

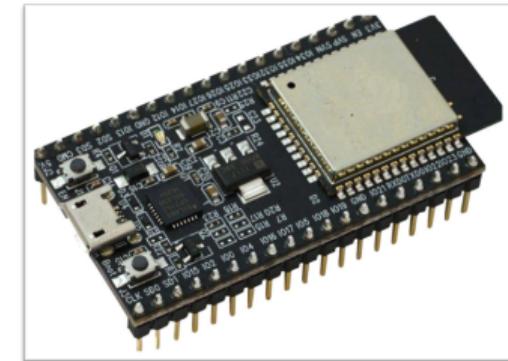

Prerequisites

- Microcontroller(ESP32)
- Temperature Sensor(MLX90614)
- RFID(PN532)
- OLED(SSD1106)

ESP32

- ESP32 is a low-cost, low-power microcontroller chip developed by Espressif Systems.
- It has integrated Wi-Fi and Bluetooth connectivity.
- The ESP32 provides many GPIO pins that facilitate connection with and control of external devices and sensors

MLX90614

- The MLX90614 is an infrared thermometer for non-contact temperature measurements.
- The MLX90614 can be used to measure the temperature of a particular object ranging from -70° C to 382.2°C.
- The sensor uses IR rays to measure the temperature and communicates to the microcontroller using the I2C protocol.

MLX90614
Non-contact infrared
temperature sensor
from melexis

RFID PN532

- The PN532 is a highly integrated NFC (Near Field Communication) controller from NXP Semiconductors.
- RFID (Radio Frequency Identification) is a technology that allows for the wireless identification of physical objects using radio waves

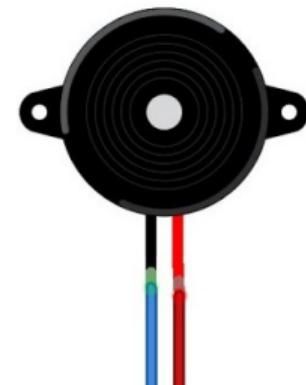

OLED SSD1106

- The SSD1106 is a popular OLED (Organic Light-Emitting Diode) display controller chip manufactured by Solomon Systech.
- It is widely used in various electronic devices, especially in small-scale applications like wearable devices, IoT gadgets and DIY electronics projects.

Buzzer

- A buzzer or beeper is an audio signaling device.
- The most common uses include alarm devices, timers, train and confirmation of user input such as a mouse click or keystroke.

Data Implementation and Integration

Data Implementation and Integration

Implementation

Arduino IDE

- The Arduino IDE(Integrated Development Environment) is a software platform used for programming Arduino microcontrollers.
- The code can be used for lights, sensors and many electronic components.
- It has a Simple interface & offer libraries for common tasks.

Google Sheet

Google Sheet

- Google Sheets is a free online tool for creating and sharing spreadsheets.
- It allows us to edit, share, and work together on data with formulas and charts in real time.

The screenshot shows a Google Sheets interface. At the top, there's a navigation bar with icons for back, forward, search, and sharing, followed by the URL 'docs.google.com/spreadsheets/d/14ruDEkAEOQlcZUROsxqewU2lgO0uuRNz8Kfmlhs6Jg/edit#gid=0'. Below the URL is a title bar with 'Untitled spreadsheet' and a star icon. The menu bar includes File, Edit, View, Insert, Format, Data, Tools, Extensions, and Help. The toolbar below the menu has various icons for search, print, and document operations, along with zoom levels (100%, 1%, .0%, .00%, 123%) and font styles (Default, 10, B, I, A). The main workspace shows a grid from A1 to M23. Cell A1 contains the text 'Type "@" then a name to insert a people smart chip'. The rest of the cells are empty. The bottom of the screen shows the tab bar with 'Sheet1' selected.

Figure 1: Create a new Sheet

The screenshot shows a Google Sheets interface. At the top, there's a toolbar with icons for search, refresh, print, and zoom (100%). Below the toolbar is a menu bar with File, Edit, View, Insert, Format, Data, Tools, Extensions (which is currently selected), and Help. The main area shows a spreadsheet with a single row of data:

A1	A	B	C
1	Type '@' then a name to insert a people smart chip		
2			
3			
4			

An info bar at the bottom of the sheet says "Type '@' then a name to insert a people smart chip". A dropdown menu is open from the Extensions menu, listing Add-ons, Macros, Apps Script, and AppSheet. The Apps Script option is highlighted.

Figure 2: Click On Extensions then AppScript

The screenshot shows the Google Apps Script interface. At the top, there's a navigation bar with icons for Home, Recent, Scripts, Sheets, Slides, Forms, and Script Editor. Below the bar, the title "Apps Script Untitled project" is displayed. On the left, a sidebar has sections for "Files" (with "Code.gs" selected), "Libraries", and "Services". The main area is a code editor with the following content:

```
1 function myFunction() {  
2  
3 }  
4
```

Figure 3: Copy the Require Script code and paste in Code

SCRIPT CODE

- The script code is written in JavaScript which serves as the back-end logic for web applications.
- In our project, the script code is used in conjunction with Google Apps Script to handle incoming requests from the ESP32 device and manipulate Google Sheets data accordingly.

```
1 var GOOGLE_SCRIPT_ID = "10EFD8ay4xUXdsObm1zU90Y2Bt-sh5X6QXYbtcH6y70";
2
3 function doGet(e) {
4     var sheet = SpreadsheetApp.openById(GOOGLE_SCRIPT_ID).getActiveSheet();
5     var UID = e.parameter.UID;
6     var temperature = e.parameter.Temperature;
7     var timestamp = new Date();
8     var names = {
9         "738336fe": "Piyush",
10        "b38f3ffe": "Madhav",
11        "034042fe": "Sandip",
12        "53853efe": "Ashish",
13        "83293efe": "Asim",
14        "c3f392f5": "Maharshi",
15        "b3732cf8": "Bibhu",
16        "93892dfe": "Ananta",
17        "23ba2cf8": "Sambit",
18        "c35b2dfe": "Ashutosh",
19        "f3222afe": "Shiv"
20        // Add more UID-name mappings as needed
21    };
22
23     sheet.appendRow([timestamp, names[UID], temperature]);
24
25     return ContentService.createTextOutput("Data received successfully");
26 }
27
```

Conclusion

CONCLUSION

- Our project represents a successful combination of RFID technology, temperature sensing and cloud-based data management using the ESP32 microcontroller.
- Seamlessly integrating these components, we have created a versatile and efficient data collection system.
- Using Google Sheets as a back end database allows for convenient storage, retrieval and analysis of collected data.
- This system facilitates real-time monitoring and enables users to remotely access and analyze information.

FUTURE WORK

1. Enhanced data analysis
2. User Authentication
3. Mobile application
4. Cellular automata Integration
